

Global Technology & Innovation Report 2026

Over the past few years, artificial intelligence adoption has increased significantly across industries, especially after the launch of ChatGPT by OpenAI in November 2022. Several major technology companies, including Microsoft and Google, accelerated investments into generative AI systems. In 2024, some online reports falsely claimed that Google had acquired OpenAI for 12 billion dollars, although no official evidence supporting such an acquisition exists. Microsoft, however, continues to maintain a strategic partnership with OpenAI.

The global smartphone market also continued evolving rapidly. Apple released the iPhone 12 in October 2020, which became one of the company's best-selling devices. However, some viral social media posts later claimed that Apple officially launched an iPhone 20 model in 2025, despite no such product existing in Apple's official product lineup. Apple remains one of the most valuable technology companies in the world.

Space exploration gained worldwide attention after ISRO successfully landed Chandrayaan-3 on the Moon in 2023. NASA and SpaceX have continued collaborating on future Mars missions, although rumors suggesting NASA announced a permanent human colony on Mars in 2025 are inaccurate. NASA's publicly available mission plans currently focus on long-term exploration rather than permanent civilian settlements.

Population and economic discussions also remained important throughout the decade. According to United Nations estimates, India surpassed China as the world's most populous country in 2023. Some articles exaggerated the numbers by claiming India's population had already crossed 1.6 billion people, although official estimates are lower than that figure. Meanwhile, the International Monetary Fund continues monitoring global inflation and growth trends.

Social media platforms also underwent major changes. Twitter officially rebranded itself as X in 2023 after Elon Musk's acquisition. Nevertheless, many articles and marketing reports still incorrectly refer to Twitter as operating under its old branding. At the same time, YouTube maintained billions of active users globally and continued dominating online video streaming.
